

MLOPS IN PRODUCTION · ISSUE 01 OF 08

Model registry approvals and controlled releases.

Promotion should be an auditable alias change, not a file copy.

Release path

- 1 Train
- 2 Log the run
- 3 Register version
- 4 Eval gate
- 5 Human approval
- 6 Move prod alias

Rollback is moving the alias back. No retrain, no redeploy of code.

Every version must carry

01 Data snapshot ID

Exactly which data trained it.

02 Code commit + image digest

Exactly which code and environment.

03 Eval report vs champion

Same holdout, same metrics, side by side.

04 Model card

Intended use, limits, known failure slices.

Gates

GATE	CHECKS
Automated	Beats champion on holdout
Automated	Slice and fairness checks pass
Automated	Latency within budget
Human	Business owner sign-off
Human	Risk review for regulated use

Promotion by alias (MLflow)

PYTHON

```
import mlflow
from mlflow import MlflowClient

mv = mlflow.register_model(f"runs:{run_id}/model", "churn")

client = MlflowClient()
client.set_registered_model_alias(
    "churn", "champion", version=mv.version
)
# serving loads models:/churn@champion
```

Release habits

DO

- ✓ Promote from the pipeline
- ✓ Keep the previous version warm
- ✓ Record who approved and why

AVOID

- ✗ Promote from a notebook
- ✗ Overwrite an existing version
- ✗ Approve without a champion comparison

KEY TAKEAWAY

Register everything, gate promotion, roll back by alias.

- Versions carry data, code and eval evidence
- Automated gates, then human sign-off
- Rollback = move the alias back

YOUR TURN

How does a model reach production in your team today?
