

FDE FIELD NOTES · ISSUE 05 OF 10

When the operator overturns the score.

Disagreement is the most valuable data you will get.

Disagreement loop

- 1 Tool suggests
- 2 Operator decides
- 3 Disagreement logged
- 4 Rule review next morning
- 5 Eval case added

A disagreement becomes a rule change or a new test case. Never a silent miss.

What to do with each case

CASE	ACTION
Operator right, rule missing	Add the rule + eval case
Operator right, data wrong	Fix the export or feature
Tool right	Show evidence, never overrule
Both reasonable	Write a tie-break rule

Write the tie-break down

01 Ordered rules

E.g. safety first, then deadline, then customer tier.

02 Owned by operations

They change the order, not the engineer.

03 Versioned

Every change has a date and a reason.

Shadow-week targets (scenario)

9/10

agreement on
consented items

0

blocked records
shown

24h

disagreement to rule
review

Illustrative targets from an interview scenario, not a customer result.

PRINCIPLE

The operator keeps the final say.

Until a week of agreement says otherwise — and even then they can take it back.

KEY TAKEAWAY

Every overturned score is a free label. Collect it.

- Log every disagreement
- Review next morning, change a rule or an eval
- Operations owns the tie-break order

YOUR TURN

How do you capture operator disagreement today — or does it disappear?
