

PLATFORM AI TRANSFORMATION PLAYBOOK · ISSUE 04 OF 06

Appropriate autonomy.

Bucket agent actions the way you already bucket production changes.

04

Four action classes

CLASS	DEFAULT	EXAMPLES
Read	Allow + trace	Search, summarize, explain a log
Propose	Allow, human merges	PR, ticket, values change
Sandbox act	Allow + evals + kill switch	Lab restart, staging hook
Production act	Deny until written down	Scale, spend, IAM, data

What moves an action up a class

01 Eval evidence

Pass rate over a fixed task set, across many runs.

02 Tested rollback

Undo proven, not assumed.

03 Written blast radius

Signed by the owning team.

04 Watched period

Time in the lower class with no incidents.

What pushes it back down

01 Model or prompt change

A new version starts in the lower class again.

02 Eval regression

Automatic demotion, not a meeting.

03 Incident

Back to Propose until the review closes.

04 New tool or data source

Scope changed, so evidence resets.

Same incident, two classes

PROPOSE

- Reads pod logs and events
- Drafts a root-cause note
- Opens a fix PR
- Human reviews and merges

SANDBOX ACT

- Lab namespace only
- Restarts the pod
- Kill switch armed
- Posts result to the ticket

THE PRINCIPLE

Autonomy is granted per action class.

It is not a personality trait of the model.

KEY TAKEAWAY

If you cannot name the rollback, it stays in Propose.

- Classes: Read, Propose, Sandbox, Production
- Promote on evidence, demote automatically
- Every version change resets trust

YOUR TURN

Where is the line in your shop between Propose and Act?
